

## **Cirris Releases New Digital IO Module**

Cirris is pleased to announce our newest product, the Digital IO module. This module connects to Cirris testers to provide greater capability than the built-in version found on most Cirris testers. Use the Digital IO module to incorporate lights, locks, switches, and other attachments to the tester. This creates a convenient way of controlling the test process without direct contact. For example, users can trigger hipot tests from a safe distance or enable lights and sounds to warn others of high voltage.

The Digital IO module's increased capabilities make it more powerful than ever before. The module's twenty input/output dual pins, along with eight dedicated output pins giving additional control of the test process. Also included are four voltage rails, capable of drawing a maximum of 500 mA combined.

For customers who want more control over their test process, visit [cirris.com](http://cirris.com) to learn about the new Digital IO module.
