

## Elftmann Tactical introduces the ELF 700 Precision Rifle Trigger

**The ELF 700 Precision Rifle Trigger** is the pinnacle of drop in trigger systems for the Remington 700 and clone precision rifles. Designed with an externally adjustable pull weight, it is infinitely adjustable from less than 2oz to over 5lbs. This trigger has the incredible feel and crisp break that ELF triggers are known for even at the highest weight. One of the unique and proprietary features of this trigger, three aerospace grade bearings are key to the consistency and smoothness of the pull. Because the bearings are a pressed fit with a pressed fit shaft pressed into a billet housing, there is absolutely no play in any components. Another proprietary technology is a 6 to 1 ratio roller bearing pivot arm that effectively eliminates any variation in set pull weight regardless of firing spring tension. Other features include an over-sized safety knob and an innovative internal bolt release mechanism which is optional if you are installing in a clone rifle. The trigger shoe is aluminum, easily adjustable, and will be available curved or flat.

“The Elftmann Remington 700 trigger may be the most versatile trigger available with a wide range of adjustment that can support hunters to competitive shooters with consistency and reliability without compromising safety.

I weighed the trigger pull in the full range of adjustment to within an ounce time and time again. The release is amazingly consistent and smooth every single shot. The adjustable trigger shoe, bolt release and oversize safety also support ease of manipulation under all shooting conditions. Whether I'm using it for competition, law enforcement application, hunting or recreational shooting this trigger does it all for me.”

-Phil Hayes – Prior USMC, 28 years Law Enforcement Tactical Operations and firearms instruction, NRA long range High Master and Distinguished Rifleman.

Other products currently produced by Elftmann Tactical include the AR Platform triggers they have become famous for, the only push-type AR-15 safety selector and the only AR platform anti-walk/anti-rotation pins that can be installed and removed without tools. The ELF Ultralight Aluminum Stock is the lightest all metal adjustable stock produced today, weighing in at a trim 5.2oz. Innovative features include ease of adjustment over the entire length of the buffer tube and silent operation - a simple turn of the knob allows full adjustment and when tightened, it is rock solid with absolutely no rattle. The warranty on all Elftmann Products is 100% satisfaction for life and unconditional.

Elftmann's product designer, Art Elftmann, is hard at work churning out innovative new designs and challenging the status quo. Stay tuned for some exciting new developments in the near future!
